Nosocomial COVID-19 Infection

Supplemental Information

Request for Information #23/24-002-RTI

Summary of data on nosocomial/hospital acquired Covid-19 infections (HACI), including the number of HACI per week, and the outcomes (acute deterioration, referral to internal medicine, increase to estimated discharge date, transfers due to Covid-19 complications, admission to ICU, and/or death). Additionally, I would like copies of all records detailing or discussing hospital acquired or nosocomial Covid-19 Infection, its prevalence, measures to mitigate, or any other related topics. Records should include but not be limited to emails, texts, meeting minutes, presentations, studies, and any other relevant communication.

Timeline: March 1, 2020, to April 20, 2023

Background

In March 2020, the Infection Prevention and Control Department (IPC) began collecting/submitting Horizon COVID-19 data which was shared with the Department of Health and the Horizon Emergency Operations Centre.

Declaration of a COVID-19 outbreak (patient or staff)

Two or more laboratory-confirmed COVID-19 cases (patients and/or staff) in the same department (unit/floor/service) within a facility during a 7-day period. It is determined that the acquisition of the infection occurred within the hospital setting and is not associated with community acquisition. This scenario describes a confirmed outbreak.

The first Horizon COVID-19 Nosocomial infection was reported on November 21, 2021.

Pages 20 to 194 of the subsequent records show (new) COVID-19 nosocomial infections for the period of March 15, 2022, to April 9, 2023

Nosocomial COVID-19 Infection

Supplemental Information

Outcomes of patients who had a nosocomial COVID-19 Infection
(i.e., prolonged Length of Stay, transfer to the ICU, death):
Horizon does not have a means to separate the outcomes of patients who had COVID-19 before being admitted and patients who contracted COVID-19 in hospital. For example, we can provide outcomes for all COVID-19 inpatients, we cannot separate nosocomial and non-nosocomial COVID-19 infection outcomes.

In July 2022 IPC (Infection Prevention and Control) was asked to compile a report of nosocomial cases of COVID-19 who died within 2 weeks of testing positive. This report included January – July 2022 data, which is included in the attached responsive records. This report was shared with the Infectious Disease/Infection Prevention and Control COVID-19 Committee and the Horizon Executive Leadership Team in August 2022. Infection Prevention and Control now monitors the number of nosocomial cases who died within 4 weeks of testing positive. This data has been included in the Infection Prevention and Control Dashboard (Q2 & Q3 2022/23 attached) which is shared with all clinical networks. Please note that this is not detailed data and cannot be used for comparison with Canadian Nosocomial Infection Surveillance Program (CNISP) data as these cases have not been reviewed in detail as per the following CNISP criteria.

"If the patient died within 30 days after positive test, please indicate the relationship of VRI to the death

☐ VRI was the cause of death[7]
☐ VRI contributed to death[8]
☐ Death is unrelated to VRI[9]
☐ Causality between VRI and death cannot be determined[10]

[7] *VRI was the cause of death (i.e., the patient had no other condition that would have caused death during this hospitalization)*
[8] *VRI contributed to death (i.e., VRI exacerbated an existing condition that led to the patient's death)*
[9] *VRI was unrelated to death*
[10] *Unable to determine the causality between VRI and death."*

All records detailing / discussing nosocomial COVID-19 (prevalence, measures to mitigate etc.).
In addition to our continuous masking, physical distancing and active/passive screening please see attached several IPC guidance documents that were developed and revised on a regular basis to curb the spread of COVID-19 within our facilities (Pages 433-461).

Infection Protection and Control began submitting Horizon COVID-19 daily data which includes nosocomial cases of COVID-19 to Health Analytics in March 2022. This data was shared with the Department of Health and Horizon Emergency Operations Centre.

Infection Prevention and Control Guidance: Cohorting Patients with Respiratory Viral Infections

December 20, 2022

Patient Category	Patient Placement	Precautions[1]
Category A 1. **Lab-confirmed** viral pathogen isolated: a. COVID-19 b. Influenza A and B, c. RSV 2. **Presence of respiratory symptoms** pending diagnosis	• Optimal placement is a single patient room. • Airborne Infection Isolation Room (AIIR) is required for Aerosol Generating Medical Procedures (AGMPs). If AIIR is not available a single occupancy room with the door closed should be used for the procedure. • May cohort patients with the **SAME** microorganism **ONLY** if a single room is unavailable (COVID-19 with COVID-19, Influenza A with Influenza A, Influenza B with Influenza B, RSV with RSV). • ***Do not routinely cohort patients with the same combinations of pathogens (e.g., COVID-19 + Influenza A with COVID-19 + Influenza A*** without consulting with IP&C. • **IF** significant bed pressures, patients with the same combination of pathogens (e.g., COVID-19 + Influenza A with COVID-19 + Influenza A) may be placed in the same room **IF**: o Both patients have acute infection or infection has resolved in the past 30 days. o **Patients are not** severely[2] or moderately[3] immunocompromised or at risk of severe complications (unvaccinated, advanced age, severe cardiopulmonary disease).	Droplet and Contact If AGMP: Full Precautions
Category B 1. **Asymptomatic** patients: a. identified as a close contact of a case part of outbreak investigation	• When possible, single patient room with PRIORITY for: o Planned/routine AGMP (e.g., nebulizer). o Severely[2] or moderately[3] immunocompromised or at risk of severe complications (unvaccinated, advanced age, severe cardiopulmonary disease). • COVID-19: if no single rooms are available, cohort contacts from the same exposure event or with recently recovered documented cases. • If significant bed pressure, asymptomatic contacts from separate exposures to the same organism can be cohorted together. In the event of exposures to different microorganisms with overlapping incubation periods, attempt to create cohorts with similar exposures (as per IP&C direction). Maintain 2-meter separation between patients, closely monitor for symptoms and promptly test if symptoms develop.	If AGMP: Full Precautions Droplet and Contact
Category C 1. No symptoms AND no exposure history	Apply normal practices as per local protocol	Routine Practices

[1] Other additional precautions still apply (e.g., MRSA, VRE, etc.)

[2] Severely Immunocompromised: solid organ transplant; bone marrow or stem cell transplant; treatment for hematological malignancy; receiving anti-B cell therapies (monoclonal antibodies targeting CD19, CD20 and CD22); or receipt of chimeric antigen receptor (CAR)-T-cell therapy

[3] Moderately Immunocompromised: active treatment with high-dose corticosteroids (i.e., ≥ 20 mg prednisone or equivalent per day when administered for ≥ 2 weeks); alkylating agents; antimetabolites; tumor necrosis factor (TNF) blockers; and other biologic agents that are immunosuppressive or immunomodulatory; moderate-severe primary immunodeficiency; treatment for solid tumors; or advanced or untreated HIV infection

Infection Prevention and Control Guidance: Aerosol Generating Medical Procedures (AGMPs) During COVID-19 Pandemic

Date Issued: June 5, 2020
Revised: February 24, 2023
Version 3.0

Infection Prevention and Control Guidance:
Aerosol Generating Medical Procedures (AGMPs) During COVID-19 Pandemic

Note: this guidance may be modified as new evidence is reviewed.

BACKGROUND:
COVID-19 is contracted primarily by close person-to-person respiratory transmission with entry points confined to the mouth, nose, and eyes. Understanding the transmission dynamics of respiratory infection has evolved significantly over the COVID-19 pandemic. Most viral respiratory infections were thought to be transmitted by large droplets (> 5 microns) landing on mucous membranes over short distances. while some respiratory pathogens (measles, varicella, mycobacteria) were spread by inhalation of small particles (< 5 microns), defined as aerosols, which remain infectious and suspended in the air over long distances and time. It is now recognized that this framework was overly simplistic, and that most transmission of respiratory viruses occurs through inhalation of respiratory particles with a wide continuum of particle sizes. Risk of transmission increases with the concentration of aerosol particles, with increased particle concentrations seen with loud talking, singing, coughing, sneezing, and increased respiratory rate. Risk of transmission also increases with proximity (particularly within a two-metre radius), and with duration of exposure. Although respiratory particles can remain suspended for long time periods, particle infectivity appears to rapidly decline over time. Most infections therefore occur by short range inhalation of a wide range of particle sizes, while long range 'airborne' transmission is not a major transmission pathway.

An AGMP is a medical procedure that typically involves manipulation of the respiratory tract and has the potential to generate large numbers of respiratory particles. The list of procedures categorized as AGMP's has evolved during the pandemic and these changes are reflected in this guidance document. This list includes procedures where epidemiologic studies involving patients with SARS-CoV-1 or SARS-CoV-2, have supported an increased risk (tracheostomy surgery, airway suctioning, bronchoscopy, intubation, manual ventilation, and nebulizer use). The other listed procedures are based upon expert opinion. Because AGMP's are associated with increased aerosol particle concentrations, Full Precautions (gown, gloves, eye protection and a fit-tested N95 respirator) are required during these procedures and must continue until the air clearance time has elapsed for the room in which the procedure has occurred. Air clearance time is defined as the time required for 99% aerosol dilution. AGMP's may be performed in an airborne infection isolation room, a single room with the door closed, or failing this, a single stretcher/bed with the curtains drawn. Because long-range airborne transmission of COVID-19 is not a major transmission pathway, bi-directional traffic can occur in a room where an AGMP has occurred prior to air clearance time, as long as Full Precautions are followed within the room. The number of persons entering such a room should be minimized to reduce the number of persons exposed, not because of the risk of long-range aerosol distribution outside of the room in question.

While the potential risk of long-range airborne transmission of COVID-19 has been clarified as unlikely during the pandemic, the risk of short-range aerosol transmission has been highlighted. Medical grade face masks have generally performed well during the routine management of patients with respiratory viral infection, with five randomized controlled trials concluding that medical masks were non-inferior to N95 respirators. The lack of a tight seal on medical masks may make them inadequate in settings where there are high respiratory particle concentrations. Given this uncertainty, the Public Health Agency of Canada now recommends that a fit-tested

N95 respirator not only be used during AGMP's, but also in settings where AGMP's are frequent (e.g., critical care areas, COVID-19 units etc.) and "may be considered in other circumstances under which the risk of exposure to aerosolized virus may occur". This permissive approach to N95 respirator use has been adopted in New Brunswick healthcare facilities as a precautionary measure since February of 2022 IPC Guidance: Continuous Use of N95 Respirators/ Face Masks and Eye Protection in Healthcare Settings During COVID-19 Pandemic (All Phases).

Transmission can also occur when hands become contaminated with respiratory secretions through direct contact with another person, or through indirect contact with contaminated surfaces (fomites), followed by inoculation when touching one's eyes, nose, or mouth. The potential for inoculation of mucous membranes through contact or respiratory particles highlights the importance of hand hygiene and ocular protection, in addition to a medical grade face mask or N95 respirator.

STRATEGIES FOR AGMP RISK REDUCTION:

1. Avoid performing unnecessary AGMPs.
2. Anticipate and plan for AGMPs.
3. Use sedation/paralytic agents to minimize the risk of aerosolization during some AGMPs such as intubation.
4. Utilize closed endotracheal suction systems for intubated patients and avoid opening the ventilator circuit.
5. Utilize an antibacterial/antiviral filter between the resuscitator bag and the endotracheal tube and on the expiratory circuit of ventilators.
6. Minimize number of HCWs in the room during an AGMP and ensure all HCWs follow Full Precautions (which include an N95 respirator, gloves, gown, and eye protection (goggles/ face shield/gasketed prescription eyewear).
7. Clearly identify room entry sites with a Full Precautions isolation sign, if there is a possible or known risk of an AGMP for a patient admitted with COVID-19. Isolation signage is not to be removed until the room has been cleaned.
8. Ensure signs describing appropriate donning and doffing of PPE are visible at the entryway for all rooms with COVID-19 patients and ensure a buddy system is used to confirm safe doffing of PPE.
9. Ensure point of care risk assessment (PCRA) is performed prior to every patient contact.
10. During an emergency situation where clinical assessment is impossible, an N95 respirator should be utilized for patients that may require an AGMP.

AGMP ENVIRONMENTAL CONTROLS:

1. Patients with suspect/confirmed COVID-19 should be cared for in a single room. The use of an Airborne Infection Isolation Room (AIIR) is the recommended standard of care when performing an AGMP. If an AIIR is not available, a single room with the door closed should be used for the procedure. Transferring a suspect/confirmed COVID-19 patient to an AIIR can be associated with increased risk to the patient under care, HCW's, other patients and the healthcare environment.
2. When a single room is unavailable and an AGMP is urgently required on a suspect/confirmed COVID-19 patient, draw privacy curtains, remove shared equipment, and minimize HCW entry.
3. After an AGMP is performed, avoid when possible opening doorway until 99% aerosol dilution has occurred. This will vary from room to room and Facilities Engineering & Property Management (FEPM)

should be contacted to determine air clearance time. Where unable to confirm, assume this is a 3-hour time period. Air clearance time may vary from 15 minutes to 3 hours depending upon ventilation system. When a supplemental HEPA scrubber is used the air clearance time must be determined by FEPM.

4. Do not enter or leave the room, unless necessary, until the number of air changes required per hour to remove airborne microorganisms following the AGMP have elapsed. If HCWs must enter/leave the single room before airway clearance is achieved, they must open and close the door slowly to minimize air drag and follow Full Precautions.

AGMP List*:

(Full Precautions and the use of an Airborne Infection Isolation Room (AIIR) is the standard of care when performing an AGMP for suspect/confirmed COVID-19 patients. A single room with the door closed is an acceptable alternative.)

- endotracheal intubation/extubation/supraglottic airway and related procedures (e.g., open endotracheal suctioning)
- bag mask ventilation
- bronchoscopy/bronchoalveolar lavage
- surgical airway (tracheotomy)
- tracheostomy tube/laryngectomy tube with procedure/manipulation
- non-invasive positive pressure ventilation (BiPAP and CPAP)
- post-mortem procedures on respiratory tissue.
- nasopharyngeal endoscopy /laryngoscopy procedures with irrigation or high-pressure suction
- sputum induction/nebulizer therapy/aerosolized medication administration
- high-flow nasal cannula (OPTIFLOW, AIRVO or equivalent)
- specific dental procedures such as high-speed drilling
- oropharyngeal, trans-sphenoidal and chest surgery
- high frequency oscillatory ventilation
- cardiopulmonary resuscitation (CPR) when accompanied by intubation or manual ventilation. (CPR and defibrillation NOT an AGMP)
- mechanical cough assist device, mechanical insufflation/exsufflation, breath stacking, cough assist or deep suctioning)

*This list of AGMPs is not exhaustive and will be modified as data evolves.

Examples of procedures that are not AGMPs**:

- collection of nasopharyngeal or throat swab
- chest tube removal/insertion (except in setting of pneumothorax)
- coughing/sneezing
- oral suctioning/hygiene
- colonoscopy
- laparoscopy
- cardiac stress test
- procedures done under regional anesthesia

- bronchial artery embolization
- percutaneous biopsy of lung mass
- low-flow oxygen (e.g., nasal prongs at 1-6L/min, OxyMask at 1-15L/min)
- oropharyngeal dysphagia procedures
- cough reflex testing
- bone marrow aspiration
- open wounds of the airway (including face, neck and/or chest)
- nasogastric tube insertion
- upper GI endoscopy
- transesophageal echocardiography
- nasopharyngoscopy/laryngoscopy procedures
- mechanical ventilation with filtered air and closed system

**N95 respirators are strongly recommended while caring for suspect/proven COVID-19 patients when the PCRA indicates a high risk of transmission (e.g., close contact over a prolonged period with a patient with frequent coughing, respiratory distress etc.).

Version 3.0

Infection Prevention & Control Guidance:
Management of Patient Exposures to COVID-19 – All Phases

Process

In an effort to decrease the risk of COVID-19 transmission, Infection Prevention and Control (IPC) works collaboratively with Employee Health Services (EHS) to ensure prompt contact tracing and management of inpatients and Healthcare Workers (HCWs) who may have been exposed to COVID-19.

Management of Inpatients exposed to a COVID-19 positive HCW/Patient

1. HCWs are advised to report positive COVID-19 test result to Employee Health Service (EHS)
2. Following notification of a COVID-19 positive HCW, EHS interviews the HCW to determine the dates the HCW was potentially infectious and identifies the patient care units or departments where the HCW worked during this time frame.
    - **Symptomatic HCW**, the HCW is considered potentially infectious 2 days before symptoms first appeared.
    - **Asymptomatic HCW**, EHS works with the HCW to determine if they may have had a COVID-19 exposure in an effort to determine the period of when they were infectious.
        - **If an exposure is identified**. The HCW is considered potentially infectious beginning 2 days after the exposure.
        - **If the date of exposure cannot be determined**. The HCW is considered infectious 2 days prior to date of specimen collection.
3. EHS completes the HCW interview and posts the completed interview to Sharepoint.
4. EHS notifies IPC of the COVID-19 positive HCW.
5. IPC reviews the interview and follows up with HCW's manager to determine dates HCW worked while infectious and identifies patients with whom the HCW had close contact (within 6 feet for a cumulative total of 15 minutes or more over a 24-hour period).
6. IPC works with the Nurse Manager or their delegate to ensure all exposed patients are managed as outlined below.

Management of Inpatients exposed to a COVID-19 positive Healthcare Worker (HCW)/Patient

1. IPC initiates patient contact tracing
    - The Most Responsible Physician (or designate) notifies inpatients/substitute decision maker of the exposure situation and of testing requirements. The disclosure process is completed in accordance with the Patient Safety Incident Management: Harmful Incidents, No Harm Incidents, Near Misses and Multi-Patient Events (HHN-SA-002) policy.
2. All inpatients who have had prolonged close contact (within 6 feet for a cumulative total of 15 minutes or more over a 24-hour period) with an infected person (from two days before to ten days after the person's symptom onset date or specimen collection date) are considered exposed.
3. All exposed inpatients are placed on Droplet/Contact Precautions and monitored twice daily for signs and symptoms of COVID-19 until 7 days after their last exposure. This applies to all patients, irrespective of whether they have been fully vaccinated.
4. IPC identifies inpatients who have recently been transferred off the unit where the exposure occurred to other wards or facilities; notifies other wards or facilities of the suspected exposure and ensures all transferred patients meeting the definition of an exposed patient are placed on Droplet/Contact Precautions and monitored twice daily while awake for signs and symptoms of COVID-19 until 7 days after their last exposure.

5. Exposed inpatients who require an urgent transfer to another unit for medical reasons are transferred on Droplet/Contact Precautions and remain on precautions for 7 days after their last exposure.
6. Exposed inpatients who are within 90 days of onset of prior COVID-19 infection may not require isolation if they remain asymptomatic. This decision is made in consultation with IPC and Infectious Diseases/Medical Microbiologist.

Patient Placement

1. All exposed inpatients may be cohorted and isolated separately in their bedspace with other similarly exposed patients who do not have COVID-19 symptoms.
2. If bed capacity and single patient rooms are limited, as a last resort an exposed asymptomatic patient may have to be cohorted with a non-exposed patient, a point-of-care risk assessment is performed to determine patient placement and/or suitability for cohorting. In this situation the following factors are considered
    - Avoid placing patients at high risk of complications, if they become infected, in rooms with patients with transmissible infections, diarrhea or open wounds
    - Delineate the boundary of the potentially contaminated patient area within the shared room, the privacy curtain between beds should be closed to minimize opportunities for direct contact
    - Prevent transmission risks from sharing of sinks and toilets
    - Assess activities of the roommates and their visitors. Roommates are selected for their ability and the ability of their visitors to comply with necessary precautions.

Testing

If an exposed inpatient develops signs and symptoms following a COVID-19 exposure, a GeneXpert rapid test is completed as per the COVID-19 Testing Directive. If an inpatient meets the definition of an exposed patient and requires surgery, they are tested as per COVID-19 Testing Algorithm (All Phases).

Additional IPC Measures

- Enhanced cleaning measures are implemented on the unit where the COVID-19 exposure occurred.
- Designated Support Persons are permitted to visit patients who have been exposed to COVID-19.
- Social Visitation is not permitted for those patients who have been exposed to COVID-19.

Infection Prevention & Control
Outbreak Management of Coronavirus Disease (COVID-19) – All Phases

Original: July 2, 2020
Revised: March 31, 2022
Revised: September 14, 2022
Revised: November 2, 2022
Revised: March 6, 2023

Purpose Statement
The purpose of this document is to provide best practice guidance for the management of COVID-19 outbreaks.

Declaring an Outbreak
IPC and EHS, in consultation with the Infectious Diseases/Medical Microbiologist, review the data to confirm patients/HCWs meet the COVID-19 case definition before declaring an outbreak.

1. **Outbreak Definitions**

COVID-19 Confirmed
A person with laboratory confirmation of infection with the virus that causes COVID-19 performed at a community hospital or reference laboratory (NML or a provincial public health laboratory) running a validated assay.

Healthcare-associated (HCA) acquired in your acute care facility (Nosocomial)

- Symptom onset ≥ 7 calendar days after admission and using best clinical judgement (e.g., symptom onset < 7 days but known epi link to a positive case). **OR**
- If patient is readmitted with a positive test < 7 days after discharge from hospital and using best clinical judgement.

HCA in another healthcare facility

- Any patient who is identified with COVID-19 not acquired at your facility, which is thought to be associated with another healthcare facility (e.g., another acute-care facility, long-term care or rehabilitation facility etc.). Retirement homes are not considered another healthcare facility.

Community-associated

- No exposure to healthcare that would have resulted in this infection (using best clinical judgement) and does not meet the criteria for a healthcare-associated infection.

COVID-19 Outbreak Involving Staff and Inpatients
Two or more laboratory-confirmed COVID-19 cases (patients and/or staff) working in the same department (unit/floor/service) within a facility within a 7-day period and it is determined that the acquisition of the infection occurred within the hospital setting and is not associated with travel or community this is considered a confirmed outbreak.

Duration of Isolation Precautions
Patients will be isolated as per IPC Guidance - Strategy for Discontinuing IPC Precautions (All Phases).

2. **Outbreak Management Team Members and Responsibilities**
   - Executive Director/Facility Manager or designate collaborates with IPC to establish a facility Outbreak Management Team (OMT).
   - Executive Director/Facility Manager/designate or IPC schedule meetings as required.
   - Implements and organizes a response to the outbreak and ensures that communication is provided to the Executive Leadership Team, HCWs, volunteers, students, patients, families and the public. These measures will be documented in an Outbreak Management Meeting Record.
   - Executive Director/Facility Manager or designate collaborates with IPC to plan and implement a response to the outbreak.

- Local Area IPC Manager acts as conduit to ID/IPC COVID-19 Committee.
- Executive Director/Facility Manager or designate act as conduit to the Horizon Executive Leadership Team.
- Ensures all outbreak activities and measures are documented in the Outbreak Management Meeting Record.
- Works with IPC and ServiceNB to ensure adequate availability of all supplies (i.e., hand hygiene products, Personal Protective Equipment (PPE), linen, laboratory testing supplies, etc.) through notification of appropriate departments.
- Collaborates with IPC and EHS regarding:
    - Cohorting HCWs assignments.
    - Cohorting HCWs to affected areas if practical or assigning HCWs to care for asymptomatic patients before symptomatic patients and batching patient care.
    - Minimizing/restricting movement of HCWs students or volunteers (when feasible), between floors/areas, especially if some areas are not affected.
- Ensures restrictions regarding patient admissions/re-admissions/transfers and activities are modified or lifted following consultation with IP&C. When restriction of admissions/transfers is unduly impacting the availability of acute care beds for patients requiring urgent care, IP&C and OMT assess the circumstances surrounding the restriction.
- Collaborates with Communications to ensure outbreak restrictions i.e., room/unit closures, admissions and transfer restrictions, are communicated to local Area stakeholders:
    - staff in the affected area.
    - staff and volunteers across the organization.
    - patient and families.
    - the broader public (e.g., on the hospitals website).
    - the media.
- Ensures social visitation restrictions remain in place.
- Ensures Designated Support Persons (DSPs) are permitted to visit as per DSP Visitation Table.

3. **Contact Tracing**

IPC will manage inpatient contact tracing (which includes a 3-day upstream patient review).

Definition of Exposed Patient

All inpatients who had prolonged close contact (within 6 feet for a cumulative total of 15 minutes or more over a 24-hour period) with the infected HCW/Patient (two days before a positive health care worker/patient's symptom onset date or specimen collection date) are considered exposed.

- All exposed inpatients are placed on Droplet/Contact Precautions and monitored twice daily for signs and symptoms of COVID-19 until 7 days after their last exposure.
- IPC identifies exposed inpatients who have recently been transferred off the unit (where the exposure occurred) to other wards or facilities; notifies other wards or facilities of the suspected exposure and ensures all transferred patients meeting the definition of an exposed patient are placed on Droplet/Contact Precautions and monitored twice daily while awake for signs and symptoms of COVID-19 until 7 days after their last exposure.
- Exposed inpatients who require an urgent transfer to another unit for medical reasons are transferred on Droplet/Contact Precautions and remain on precautions for 7 days after their last exposure.
- Non-exposed patients on an outbreak unit do not require isolation.
- Exposed inpatients who are within 90 days of onset of prior COVID-19 infection do not require isolation if they remain asymptomatic.
- EHS manage HCW/Volunteer and Physician contact tracing.

4. **COVID-19 Testing**

COVID-19 testing will be performed on symptomatic patients, HCWs and DSPs. If an exposed inpatient develops signs and symptoms following a COVID-19 exposure, a GeneXpert rapid test is completed as per the COVID-19 Testing Directive. f an inpatient meets the definition of an exposed patient and requires surgery they are tested as per the COVID-19 Testing Algorithm (All Phases).

5. **Administrative Measures & Notifications**

Responsible Person(s)	Required Actions and/or Notifications
Infection Prevention and Control	• notifies appropriate HCWs/departments within the facility as indicated by local Area practices (i.e., Administration, EHS and Environmental Services (EVS) and ServiceNB). Outbreak Notification Memo (Appendix B). • posts outbreak signage at the entrance to the unit and/or facility advising HCWs and DSPs of the necessary precautions and informing the public that social visitors are not permitted. • maintains a presence on the outbreak unit to provide education on COVID-19 symptom surveillance and reporting, the key elements in an outbreak response and PPE donning and doffing ensuring the "Buddy" system has been implemented. • initiates inpatient contact tracing • notifies the Regional Medical Officer of Health of outbreak as per) Public Health New Brunswick Notifiable Diseases and Events Notification Form. • advises EVS regarding need for enhanced environmental cleaning. • audits hand hygiene compliance, PPE accessibility and compliance. • maintains surveillance to identify and report new cases. • maintains and updates a Daily Line List - COVID-19 Respiratory Outbreaks in an Acute Care Facility
Nurse Manager/ Charge Nurse	• reviews inpatient census to determine if there are patients who require aerosol generating medical procedures (AGMPs) such as CPAP, BiPAP or Cough Assist machine. If patients require AGMP, consults attending Physician to determine if AGMP is essential or nonessential. If it is determined that the therapy is essential, consult IPC regarding patient placement. • in consultation with EHS reviews HCW vaccination rates and promotes HCW vaccination. • monitors HCW absences in association with the outbreak. • advises HCWs to test as per COVID-19 and Influenza HCW Guidelines • ensures attending physician is contacted in a timely fashion to strongly consider using the Horizon COVID-19 Clinical Order Set, supported by treatment guidance through the First Line app. • ensures proper collection of appropriate specimens. • ensures work areas, i.e., nursing station, medication carts/room and patient care environment are accessible and free of clutter for EVS to clean and disinfect all surfaces • cancels or postpones previously booked non-patient events (i.e., meetings, HCWs in-service) on an outbreak unit/facility

Responsible Person(s)	Required Actions and/or Notifications
	• ensures HCWs do not eat or drink at the Nurses station or charting areas as per Infection Prevention and Control Routine Practices (HHN-IC-015). HCWs may eat and drink in designated staff lounges.
Attending Physician or designate	• notifies inpatients/substitute decision maker of the outbreak situation and isolation requirements. • The disclosure process is completed in accordance with the Patient Safety Incident Management: Harmful Incidents, No Harm Incidents, Near Misses and Multi-Patient Events (HHN-SA-002) policy. • reviews inpatient vaccination status. Works with Nursing and Pharmacy to have COVID-19 vaccination offered to those inpatients who are unvaccinated or partially vaccinated as per vaccine schedule. • manages COVID-19 patients using the Horizon COVID-19 Clinical Order Set, supported by treatment guidance through the First Line app. Members of the COVID-19 treatment team will be available where possible for informal/formal guidance.
EHS	• ensures Nurse Manager/Charge Nurse can access the COVID-19 and Influenza HCW Guidelines for guidance and recommendation for HCWs on an outbreak unit. • provides updates on HCW exclusions to the Nurse Manager/Charge Nurse and IPC. • ensures that HCWs are advised of recommendations and work restrictions. • directs HCWs and Physicians working on Outbreak Units to be tested as per the Health Care Worker (HCW) Scenario Guidelines
Responsible Managers	• advise symptomatic HCWs to isolate immediately and contact EHS for assessment and decision regarding work exclusion. • follows up with EHS to review HCW vaccination rates and promotes HCW vaccination. • monitor HCW absences in association with the outbreak.

6. Enhanced Environmental Cleaning Measures

Responsible Person(s)	Required Actions and/or Notifications
EVS	• implements enhanced environmental cleaning • cleans and disinfects patient rooms ensuring *frequently touch surfaces* such as bed rails, call bell cords, bathroom surfaces (taps, toilet handles), doorknobs, light switches are cleaned twice per day. • use fresh mop head, cloths, cleaning supplies and cleaning solutions to clean affected rooms and provides a dedicated toilet brush for each toilet/commode • cleans and disinfects, nurses' station, common areas and *frequently touch surfaces* such as computer carts, medication carts, computer screens, telephones, touch screens etc. twice a day and when soiled, or as recommended by IPC. • cleans staff lounge/lunchroom after breaks and mealtimes. • terminally cleans the patient's room/bedspace when the patient is taken off isolation.

Responsible Person(s)	Required Actions and/or Notifications
	• consults with Nursing to identify items that cannot be cleaned/disinfected and ensures they are properly discarded. • cleans the following common areas, i.e., nutrition centre, staff lounge and family rooms, on the affected unit when the outbreak is declared over.
Nursing	• initiates Droplet/Contact Precautions for all symptomatic and exposed patients ('exposed' defined in 3 above), and posts Droplet Contact Precautions Sign at the entrance of patient's room or bed space. • provides the patient with information on Additional Isolation Precautions (HHN-0605). • ensures that reusable non-critical equipment is dedicated to the use of one patient. If equipment cannot be dedicated it is cleaned and disinfected with an approved hospital grade cleaner/disinfectant. Refer to Cleaning/Disinfection of Non-Critical Patient Care Equipment and Electronic Devices (HHN- IC-006). • ensures that patients personal care items (e.g., tissues, lotions, soaps, razors) and disposable equipment, such as containers used for blood collection or tourniquets left in the room following transfer/discharge are discarded. • ensures work areas, i.e., nursing station, medication carts/room and patient care environment are accessible and free of clutter for EVS to clean and disinfect all surfaces • advises DSPs to practice good hand hygiene and wear the appropriate PPE (i.e., gloves, gown, procedure/surgical mask, eye protection). Demonstrates for DSPs how to perform hand hygiene and don and doff PPE. • advises DSPs to only visit one patient and exit the facility immediately after the visit • provides patient with discharge instructions as outlined in Patient Discharges.
EVS & Nursing	• discard items that cannot be appropriately cleaned and disinfected upon patient discharge or transfer

7. COVID-19 Outbreak Strategies

Category	Outbreak Strategies
Patient Transfers & Cohorting	• Infected patients may be transferred to the facility COVID -19 Unit if available and if it is determined patient requires admission to the unit. • For infected patients identified in a semi-private/ward setting, all attempts are made to transfer the patient to a private room. The exposed patients remain cohorted and isolated separately on Droplet/Contact Precautions for 7 days from the last date of exposure. • patients will wear a medical grade face mask during transfer (if tolerated). • If no COVID-19 Unit or no transfer required, COVID-19 patients will be managed in place on the outbreak unit. • The outbreak unit will be divided into an outbreak area (COVID-19 positive patients and patients potentially exposed to COVID-19) and a

Category	Outbreak Strategies
	non-outbreak area (newly admitted patients and patients transferred from non-outbreak unit). • Transfer symptomatic patients to a single room. If a single room is not available, patients with infection due to the same micro-organism may be cohorted following consultation with IP&C as per IPC Guidance - Cohorting Patients with Respiratory Viral Infections. • Isolation precautions on recovered patients are discontinued as per IPC Guidance - Symptom-Based Strategy for Discontinuing IPC Precautions (All Phases). Recovered patients can be used as a buffer to divide the outbreak area from new admissions who have not been exposed. • Unit reconfiguration: When multiple units have COVID-19 nosocomial outbreaks, multiple exposed patients from different units may be combined in one unit so that a non- outbreak unit is made available for patient care. • When the outbreak strategies outlined above have been implemented and operational capacities remain challenged due to patient flow issues, the IPC Guidance: Cohorting Strategies to Facilitate Patient Flow During COVID-19 Pandemic - All Phases (Appendix A) will be followed to provide additional approaches for cohorting COVID -19 suspect, positive, or recently recovered patients. • If a positive patient is transferred, they remain isolated as per IPC Guidance - Symptom-Based Strategy for Discontinuing IPC Precautions (All Phases). • If an exposed patient is transferred from an outbreak unit to another unit/facility, the patient will be managed on Droplet/Contact Precautions for 7 days after their last exposure. • The outbreak facility notifies the transporting HCWs and the receiving facility that the exposed patient is being transferred from a unit experiencing an outbreak. If tolerated, symptomatic patients should wear a medical grade face mask during transfer.
Patient Admissions	• Newly diagnosed COVID-19 patients being admitted to hospital can be managed with the COVID-19 patient cohort. • Recently recovered COVID-19 patients (Patients who are within 90 days of onset of prior COVID-19 infection) can be admitted to outbreak units. • Newly admitted patients admitted to the non-outbreak section will not require Droplet/Contact Isolation • Patients will be managed as per IPC Guidelines: Managing COVID-19 Patients Outside of COVID-19 Designated Units - All Phases
Patient Discharges	• If an admission/ transfer to another facility occurs during a confirmed COVID-19 outbreak, Nursing collaborates with the receiving facility prior to patient discharge. The patient is not transferred until the receiving facility is aware of: o the outbreak o IPC precautions required • Patient transfers from an outbreak unit to long term care or an adult residential facility, will be made on a case-by-case basis involving the home, the primary care provider, in consultation with the Regional

Category	Outbreak Strategies
	Medical Officer of Health and Social Development prior to discharge. The hospital physician works with the receiving physician (if different) and the home to arrange the appropriate transfer. • If Patient is discharged home, a risk assessment is completed to determine if they are a high or low risk contact o **High Risk Patients Discharged from an Outbreak Unit** ▪ Patient is COVID-19 positive **OR** ▪ Patient shared a room with a COVID-19 positive patient **OR** ▪ Patient had direct contact with a COVID-19 positive HCW o **Discharge instructions for High-Risk patients will include:** ▪ COVID-19 positive patients will be advised to follow Provincial Public Health Guidelines GNB: What To Do If You Have COVID-19 ▪ Patients who have had close contact with a COVID- 19 positive patient or HCW are advised that they must monitor for symptoms and arrange for COVID- 19 testing as per GNB COVID-19 Testing Guidelines
Patient Activities	• Nursing consults with IPC for assistance with adapting patient activities. • Nursing cancels all group activities for the duration of the outbreak: o Food sharing activities (BBQs, communal cooking, potluck parties, bake sales, etc.) o Group activities where there is hand contact (dancing, playing cards, puzzles, etc.) • Nursing ensures that medically necessary activities and appointments are kept and notifies the receiving facility/department so that appropriate precautions can be taken for the patient. • treatments such as physiotherapy or occupational therapy are restricted, when possible, to the symptomatic patient's room. Otherwise, if this therapy needs to be provided outside the patient's room, it will be provided while patient wears a mask, follows appropriate hand hygiene as well as 2 metre physical distancing. • Nursing consults with IPC for assistance with adapting patient activities. • patients requesting a leave of absence from a facility/unit that is under restrictions due to a COVID-19 outbreak may do so if the patient is asymptomatic. Nursing advises patients that if they become symptomatic while away from their facility, they should contact the Nursing Unit for instructions.
Infection Control Precautions	• Nursing monitors the index case and all other exposed inpatients for vital signs and symptoms of COVID -19 twice per day while awake to assess for a change in health status. • Nursing will ensure close contacts of the COVID-19 positive patient are managed on Droplet/Contact Precautions. • Patients who are within 90 days of onset of prior COVID-19 infection do not require isolation or testing if they remain asymptomatic. • Nursing ensures all patients wear a medical grade face mask when out of their room for essential medical procedures.

Category	Outbreak Strategies
	• While awake and where tolerated, patients will wear a medical grade face mask when they are within 2 meters of other individuals (e.g., when staff enter their single-bed room and when in a multi-bedroom). • Masks will not be used for patients who have difficulty breathing who are unable to remove the mask on their own (e.g., due to decreased level of consciousness, young age, mental illness, cognitive impairment or physical ability. • Patients who are on Droplet/Contact Precautions should remain in their rooms and not encouraged to leave their room. • IPC and Nursing ensure symptomatic patients are restricted to their room on Droplet/Contact Precautions with meals delivered to them. • IPC and Nursing restrict asymptomatic positive patients to the outbreak section of the unit, unless a transfer is clinically indicated. • If transfer is clinically indicated, the receiving unit/facility is notified that the patient should be placed on droplet/contact precautions. Isolation precautions are discontinued as per IPC Guidance - Symptom-Based Strategy for Discontinuing IPC Precautions (All Phases). • Exposed inpatients who require an urgent transfer to another unit for medical reasons are transferred on Droplet/Contact Precautions and remain on precautions for 7 days after their last exposure. • Isolation precautions on recovered patients are discontinued. Recovered patients can be used as a buffer to divide active outbreak units and new admissions who have not been exposed.
Staff	• Staff cancel or postpone previously booked non-patient events (i.e., meetings, HCWs in- service) on an outbreak unit/facility. • Cohorting of staff dedicated to each section will be applied when possible. • HCWs who must enter the Outbreak Unit to deliver supplies, meal trays and/or pharmaceuticals are required to wear a medical grade face mask, they are not required to wear eye protection or don a gown and gloves.

8. Additional Restrictions & Strategies

Activity or Individual(s)	Restrictions
Healthcare Worker Restrictions	• Refer to COVID-19 and Influenza HCW Guidelines. • The number of HCWs caring for COVID-19 patients should be minimized whenever possible. • HCWs should be cohorted to work only with COVID-19 patients whenever possible. • HCWs working on an outbreak unit (or a facility with an outbreak) who work at other facilities must notify EHS at those facilities about their exposure to the outbreak unit.
Visitor Restrictions	• All Social Visitors are restricted. • DSPs are permitted • Communications advise the Public through various methods such as social media, PSA, and signage, regarding visitor restrictions.
Volunteer Restrictions	• Volunteers are not permitted to work during an outbreak.

Activity or Individual(s)	Restrictions
Meals/Nourishment Areas & Sharing Food	• IPC ensures that the dining room (if applicable) on the affected Nursing unit is closed, and patients dine in their room. • All communal activities are postponed until outbreak has been declared over. • IPC and Nursing restrict access to kitchen/nourishment areas and there is no communal sharing of food in outbreak areas. • Nursing ensures shared food containers are removed and medication water pitchers are sent daily to Nutrition and Food Service for cleaning. **NOTE:** Use of disposable plates and cutlery by symptomatic patients is not required
Pets	• Pets will not visit on affected units.
Recreational Reading Material and Games	• Alcohol based hand rub is available in waiting rooms and patient lounges for the patient/public to clean their hands after handling shared magazines, books and puzzles. • Nursing provides children or adults on Droplet/Contact Precautions with dedicated toys, books, magazines, and puzzles, which are discarded, and personal items taken home on discharge. **IMPORTANT**: Volunteer carts that take books and magazines to patients are not taken into patient bed spaces or rooms where Droplet/Contact Precautions are in place, or onto units with outbreaks.

9. **Declaring the Outbreak Over and Surveillance Post-Outbreak**

An outbreak may be declared over when two viral cycles (14 days) have passed from the last date that others were potentially exposed to a case during the communicable phase of illness. (The case may be a healthcare worker (HCW), a patient, or a DSP who was present in the care setting during the communicable phase of illness, and recommended personal protective equipment was not used by others thus resulting in a potential exposure).

However, in the following situations an outbreak may be declared over after one viral cycle (7 days) from the last date that others were potentially exposed to a case during the communicable phase of illness:

When the trigger to declare the outbreak was 2 cases of hospital-acquired infection (nosocomial) or all acquired cases involving roommates in one room, where the case investigation has identified the most likely source and contact tracing has been completed for the patients and HCWs, and no additional cases were identified.

- Once the outbreak is declared over:
  - Notify all key stakeholders of the end of the outbreak.
  - Remove signage related specifically to the outbreak.
  - Perform a terminal clean of the unit.
  - Restore patient/resident flow patterns for discharge and transfer.
  - Debrief with unit/facility leadership and staff to evaluate the management of the outbreak and implement all corrective actions, as required.
- IPC surveillance is maintained after the outbreak has been declared over and after restrictions have been lifted.

- IPC in consultation with Infectious Diseases/Medical Microbiologist assess to determine if restrictions should be implemented if new cases of HCA (nosocomial) COVID-19 are identified following the outbreak.
- IPC and Nurse Manager/Charge Nurse facilitate a debrief session when the outbreak is declared over.

DEFINITIONS

Frequently Touch Surfaces: Include but are not limited to: bed rails, call bell cords, bathroom surfaces (taps, toilet handles), door knobs, light switches, elevator buttons, tables, counter tops, nourishment areas (fridges, ice machines, cupboard handles).

Infection Prevention and Control Guidance:
Cohorting Strategies to Facilitate Patient Flow During COVID-19 Pandemic - All Phases

In the event of an outbreak, the strategies outlined in the Infection Prevention & Control Outbreak Management of Coronavirus Disease (COVID-19) - All Phases document take precedent and the following guideline will be used as a complimentary tool to provide different approaches for cohorting COVID -19 suspect, positive, or recently recovered patients. These strategies will support Horizon facilities to maintain their operational capacities by facilitating patient flow.

Cohorting is the practice of grouping together patients who are colonized or infected with the same organism to confine their care to one area and prevent contact with other patients. Cohorts are created based on clinical diagnosis, microbiologic confirmation when available, epidemiology, and mode of transmission of the infectious agent.

Cohorting is often used to confine and contain the transmission of a virus but may but may also be used to provide staffing efficiencies and optimize capacity.

Decisions around cohorting should take into consideration the period of infectivity and reinfection risk by variant status and rates of community transmission. The cohorting of patients is performed in consultation with Infection Prevention and Control.

Infection Prevention and Control recommends the following for suspect/confirmed COVID-19 patients:

- Patients with mild-moderate symptoms and no risk for an aerosol generating medical procedure (AGMP) are placed on Droplet/Contact Precautions in a private room with a dedicated bathroom whenever possible.
- Patients with severe/critical illness, at risk for an AGMP are placed on Full Precautions in an airborne infection isolation room (AIIR) or private room with the door closed.

However, in response to the increasing number of COVID-19 admissions to our acute care facilities and concern regarding the high number of admitted patients remaining in emergency departments the following IPC cohorting strategies may be implemented.

Strategies for Patient Cohorting			
Patient	**Preferred**	**Alternative**	**Accommodation**
*Patients with PCR confirmed COVID-19 or positive POCT with compatible COVID-19 symptom history.	Cohortwith patients with confirmed COVID-19.	Cohort with: **recently recovered patients.	May cohort in multi-bed rooms. Maintain separation of 2 metres between each patient's bed space and ensure privacy curtains are closed.
Suspect COVID-19: Symptomatic patients.	Do not cohort.	Do not cohort.	Private room or bedspace isolation with privacy curtains closed
Suspect COVID-19: Asymptomatic patients	Cohort with other ***suspect COVID- 19 asymptomatic patients.	Cohort with ***other asymptomatic patients (non-suspect COVID-19)	May cohort in multi-bed rooms. Maintain separation of 2 metres between each patient's bed space and ensure privacy curtains are closed.
**Recently recovered patients	Cohort with other asymptomatic patients (non-suspect COVID-19).	Cohort with: *Patients who are suspect or confirmed COVID- 19. **Recently recovered patients.	May cohort in multi-bed rooms. Maintain separation of 2 metres between each patient's bed space and ensure privacy curtains are closed

* Patients with confirmed COVID-19 can be cohorted regardless of Variant of Concern (VOC) status. Transmission of a different VOC to an individual that already has active COVID-19 infection has not been described. However, with 100% Omicron in circulation, cohorting of active COVID-19 cases with unknown VOC status would not confer a significant risk to the patients.

** Recently recovered patients are those who have been taken off Additional Precautions AND are within 90 days of their infection AND were diagnosed with COVID-19 on or after January 1, 2022 (when the Omicron variant was identified as the predominant strain of COVID-19 in NB).

*** Avoid placing suspect patients in the same room with patients who, if they were to become infected, would be at high risk for complications or who may facilitate transmission (e.g., elderly, patients with cardiopulmonary disease, immunocompromised, unvaccinated).

Additional IPC Considerations for Patient Cohorting

- Patient cohorting should only be considered when appropriate facilities and staffing resources are available.
- Geographical cohorting refers to restricting patients who are infected or colonized with the same microorganism to several rooms along a corridor or an entire clinical unit. Use of this practice can limit transmission by separating those who are infected or colonized to a specified area away from those who are not.
- Multiple bed moves to accommodate cohorting can be associated with unintended consequences including increased potential risk of transmission, increased strain on staffing, and adverse effects on patient care and safety such as increase in patient falls and risk of patient disorientation.
- When considering cohorting, other factors that impact both cohorting and bed flow should be evaluated:
    - Turnaround times of relevant diagnostic test results
    - Environmental and portering service resources
    - Need to accommodate a caregiver/DSP/aide
    - Medical and safety needs of the patient
    - Skill set of clinical staff
- Cohorting should never compromise infection control practices, Additional Precautions must be maintained, and patients must be isolated separately in their bedspace.
- Patients and their Designated Support Persons are made aware of the precautions to be followed and are willing and able to comply with these precautions.
- PPE donning and doffing posters are visible and accessible to guide HCWs in the appropriate use of PPE between cohorts.
- Patient care equipment must be dedicated to each patient or cleaned and disinfected between patients.
- Patients should not be cohorted if there is a risk of transmission of other infections, e.g., Clostridium difficile infection.
- Prioritize AIIRs for patients with suspect/confirmed COVID-19 who require an AGMP.
- Prioritize private rooms for:
    - Patients with suspect (symptomatic) or confirmed COVID-19
    - Patients with confirmed COVID-19 and history of international travel in the last 10 days.
- Prioritize multi-bed rooms for cohorting:
    - Patients with confirmed COVID-19
    - Patients recently recovered from COVID-19
    - Asymptomatic suspect patients
- Cohorting of suspect/confirmed COVID-19 patients in unconventional spaces (hallways, open bays, repurposed non-clinical rooms) is not supported.
- Spaces used for cohorting should:
    - Accommodate spatial separation required between patients within a cohort (ideally > 2m between bedspaces) including a commode at bedside if feasible.
    - Accommodate any safety or medical needs of patients

RÉSEAU DE SANTÉ Horizon HEALTH NETWORK

Memo

To: Horizon Emergency Departments

From: _____, Infection Prevention and Control
Lisa Hebert, Regional Clinical Lead Employee Health

cc: Merita MacMillan, Regional Lead Infection Prevention and Control
employeehealth@horizonnb.ca

Date:

Re: **COVID-19 Outbreak**

On dd/mm/yyyy, Infection Prevention and Control (IPC) declared a COVID-19 Outbreak on nursing unit. The following IPC precautions have been implemented to ensure the safety of Patients and Health Care Workers (HCWs):

- All identified exposed patients have been placed on Isolation Precautions.
- Patients are being monitored for signs and symptoms of COVID-19.
- Enhanced cleaning measures have been implemented
- Designated Support Persons will be permitted on a COVID-19 outbreak unit by exception as outlined in the Horizon Designated Support Person Operational Plan.
- HCWs will wear facial protection (N95 respirator/well fitted medical grade facemask and eye protection (goggles/face shield) when providing direct and indirect patient care while in patient room/bedspace (such as meal delivery and environmental services).

Employee Health Recommendations for Testing

- HCWs who have worked greater than 15minutes (cumulative time) on the outbreak unit, five days prior to the declaration of the outbreak are encouraged to book a PCR test. Please refer to the HCW Scenario Guidelines COVID-19, Scenario #7 for additional information.
- Asymptomatic HCWs can present to on site Employee Health Testing Center where available or through GNB.ca for testing.
- HCWs with a prior positive POCT or PCR test in the last 90 days do not require any testing unless greater than 30 days and develop new symptoms. These HCWs should refer to the scenario guideline at HCW Scenario Guidelines and notify Employee Health.

Infection Prevention & Control COVID-19 Key Performance Indicators

Reporting Period: January 1, 2022 - July 31, 2022

Network	Performance Indicator	Definition	Horizon Area	Total # Nosocomial COVID-19 Cases
Infection Control	Healthcare Associated (Nosocomial) COVID-19 Cases	Patient symptom onset ≥ 7 calendar days after admission and using best clinical judgement (e.g. symptom onset < 7 days but known epi link to a positive case). **OR** Patient is readmitted with a positive test < 7 days after discharge from hospital and using best clinical judgement	Moncton Area	135
			Saint John Area	319
			Fredericton ansd URV Area	137
			Miramichi Area	35
			Horizon	**626**

Network	Performance Indicator	Definition	Horizon Area	Total # of Deaths
Infection Control	Healthcare Associated (Nosocomial) COVID-19 Cases, resulting in death	Patients who acquired Healthcare Associated (Nosocomial) COVID-19 and died within 2 weeks of their COVID-19 diagnosis.	Moncton Area	14
			Saint John Area	14
			Fredericton ansd URV Area	7
			Miramichi Area	6
			Horizon	**41**
